

20 August 2025

Further strong gold results from extensional and infill drilling at the Sandstone Gold Project

- Brightstar has received further results from the ongoing RC drilling program at the **1.5Moz @ 1.5g/t Au** Sandstone Gold Project, located in the East Murchison region of WA.
- Assay results returned from 87 extensional and infill RC drillholes for ~11,000m at several deposits across both Sandstone and Montague within the Sandstone Hub
- The drilling was completed as part of the ~100,000m drilling program underway, designed to **significantly increase the size and quality of the existing Mineral Resource** and underpin the Pre-Feasibility Study underway due for delivery in 2026
- Post successful completion of the Aurumin Limited merger underway, **Brightstar will emerge with material 2.4Moz @ 1.5g/t Au Mineral Resource in Sandstone**
- Significant, high-grade shallow intercepts from the different deposits / prospects include:

Musketeer Deposit

- INRC25086: **Extensional**
 - **8m @ 4.50g/t Au from 95m, including 1m @ 19.5g/t Au from 99m**
- INRC25115: **Extensional**
 - **4m @ 4.85g/t Au from 99m, including 1m @ 11.8g/t Au from 99m**
- INRC25118: **Extensional**
 - **5m @ 4.12g/t Au from 157m, including 1m @ 14.2g/t Au from 160m**
- INRC25084: **Infill**
 - **4m @ 5.50g/t Au from 82m, including 1m @ 20.1g/t Au from 82m**
- INRC25081: **Infill**
 - **6m @ 3.47g/t Au from 94m, including 2m @ 7.68g/t Au from 94m**
- INRC25082: **Infill**
 - **7m @ 2.28g/t Au from 29m, including 1m @ 7.69g/t Au from 30m; and**
 - **6m @ 2.75g/t Au from 53m, including 2m @ 6.97g/t Au from 55m**

Indomitable East Deposit

- INRC25092: **Extensional**
 - **4m @ 2.06g/t Au from 189m**
- INRC25095: **Infill**
 - **26m @ 1.39g/t Au from 22m, including 1m @ 10.4g/t Au from 30m**

Cessna Prospect

- INRC25113: **Extensional**
 - **6m @ 6.91g/t Au from 28m, including 4m @ 9.44g/t Au from 28m**

Lord Henry Deposit

- LHRC25008: **Extensional**
 - **3m @ 9.29g/t Au from 55m**, including **1m @ 25.1g/t Au from 55m**, and
 - **4m @ 19.3g/t Au from 98m**, including **1m @ 58.5g/t Au from 99m**
- LHRC25004: **Extensional**
 - **3m @ 2.66g/t Au from 92m**, including **1m @ 4.69g/t Au from 92m**

Lords Corridor Prospect

- LNRC25040: **Extensional**
 - **24m @ 1.14g/t Au from 16m**, including **4m @ 3.77g/t Au from 36m**

Duplex Prospect

- DXRC25012: **Extensional**
 - **2m @ 7.94g/t Au from 145m**, including **1m @ 15.4g/t Au from 145m**
- DXRC25008: **Extensional**
 - **5m @ 2.71g/t Au from 154m**, including **1m @ 9.93g/t Au from 156m**
- DXRC25001: **Extensional**
 - **2m @ 5.87g/t Au from 177m**, including **1m @ 11.0g/t Au from 177m**

Brightstar Resources Limited (ASX: BTR) (**Brightstar**) is pleased to announce results from further Reverse Circulation (**RC**) drilling programs at the Sandstone Hub, which hosts a current Mineral Resource Estimate (**MRE**) of **1.5Moz @ 1.5g/t Au**.

The **Musketeer** and **Indomitable East deposits** form part of the Indomitable Camp, which has a total resource of **8.1Mt at 0.9g/t Au for 288koz Au**. RC drilling was designed to infill the drilling inside the conceptual pit shells (optimised at a conservative gold price of \$2,500 AUD/oz), in order to upgrade the MRE classification to Indicated status, progressing towards a Pre-Feasibility Study (PFS) targeted for delivery in Q2 2026. The **Cessna prospect** also forms part of the Indomitable Camp. RC drilling was designed to follow up significant gold mineralisation intersected in previous drilling.

The **Lord Henry deposit** forms part of the Lords Camp, which hosts a MRE of **7.8Mt @ 1.5g/t Au for 389koz Au** across the Lord Nelson and Lord Henry deposits. RC drilling targeted mineralisation outside the conceptual A\$2,500/oz pit shell for inclusion in a future MRE update. The **Lords Corridor prospect** is situated between the Lord Henry and Lord Nelson deposits. Drilling was designed to test several early stage, conceptual targets along the granodiorite and ultramafic contact and to follow up mineralisation intersected in previous drilling.

The **Duplex prospect** is located approximately 3.5km south of the Montague-Boulder Deposit, which has a total resource of **3.1Mt @ 1.7g/t Au for 163koz Au**. RC drilling targeted extensions to high-grade mineralisation intersected in previous drilling.

Brightstar's Managing Director, Alex Rovira, commented:

"Drilling results from the Sandstone hub continue to justify our strong confidence in the project. These assays demonstrate the potential for material resource growth at several of the deposits and give an indication of the immense prospectivity outside of the current resource base. The Brightstar exploration team is continuing to test new targets across the portfolio in tandem with the infill, geotechnical, and metallurgical drilling programs required for the timely delivery of the Sandstone PFS in 2026."

Following the successful completion of the Scheme of Arrangement with Aurumin Limited underway, Brightstar will emerge with a significant Mineral Resource base of 2.4Moz @ 1.5g/t Au with material exploration upside across the tenement package, positioning Brightstar favourably to advance the enlarged Sandstone project area into development.

The drill rigs have temporarily relocated to the Menzies and Laverton Hubs to drill exploration and resource definition programs at the Second Fortune, Fish, and Yunndaga deposits. Drilling will then recommence at the Sandstone Hub in early September with approximately 100km of drilling planned in FY26."

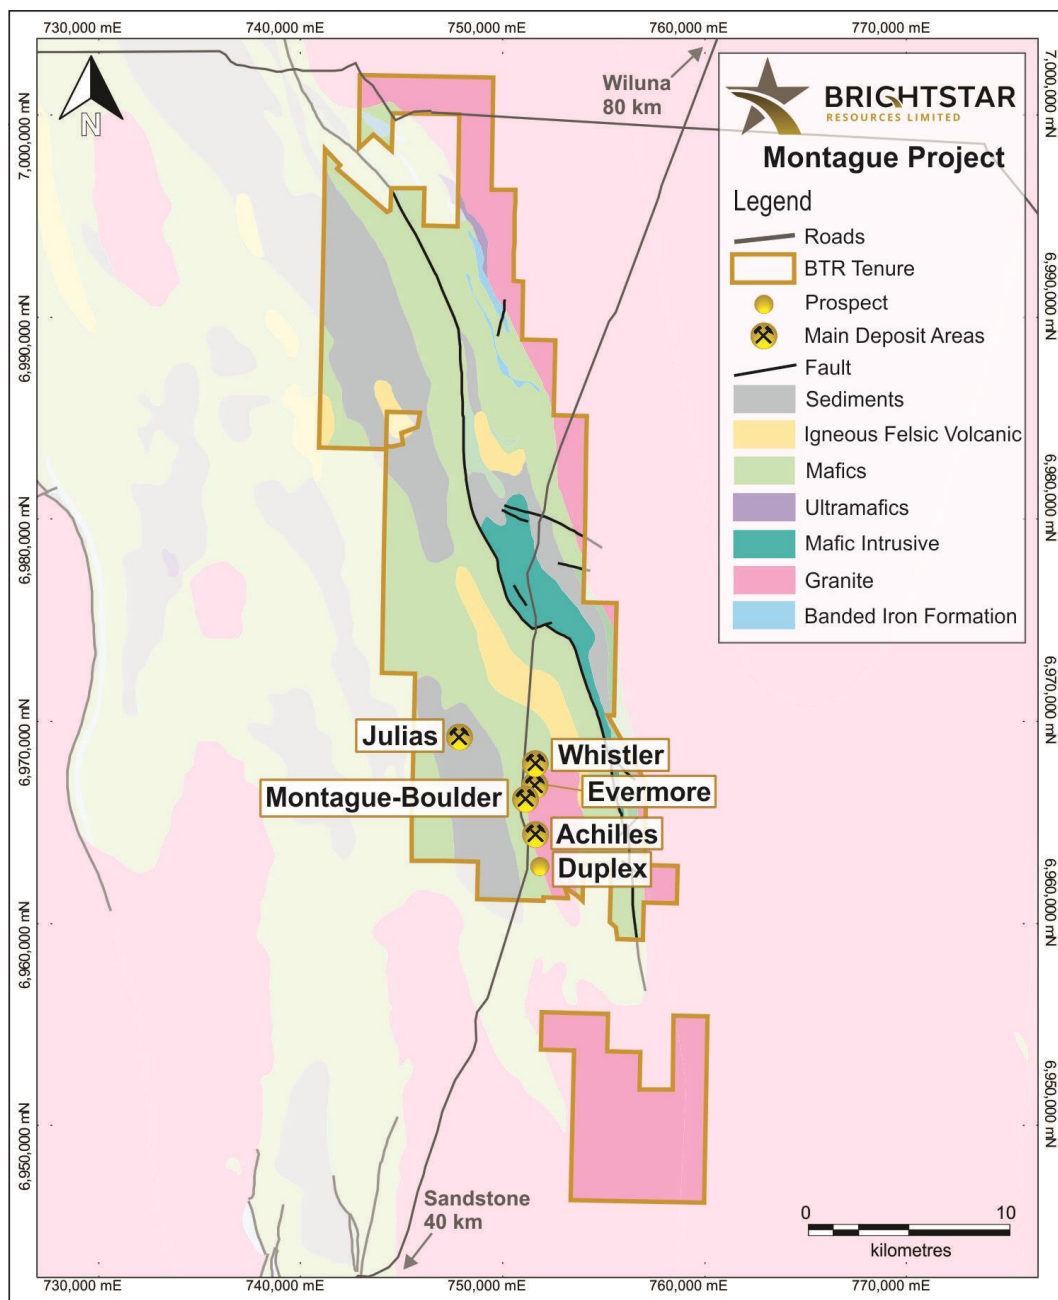

Figure 2 - Location of Whistler Deposit and Duplex prospect within Brightstar's Montague Gold Project

TECHNICAL DISCUSSION

SANDSTONE PROJECT

Musketeer Deposit

The Musketeer deposit has a current Inferred Mineral Resource of **1.4Mt at 1.3g/t gold for 59koz**, with 0.8Mt at 1.5g/t Au for 40koz gold located within a conceptual pit shell optimised at a conservative \$2,500 AUD/oz gold price.

Gold mineralisation appears to be associated with a southwest-northeast striking banded iron formation (BIF) within a mafic-ultramafic package and northwest-southeast crosscutting structures.

A total of **61 RC drillholes for ~6,500m** were drilled at Musketeer, targeting both Mineral Resource upgrades and extensions at depth and along strike. Assay results for 34 RC drill holes for ~3,100m were reported on 16 June 2025¹. This release includes assay results for a further 27 RC drill holes for ~3,450m drilled across the deposit.

The drillholes targeting extensions to the deposit, down-dip from the deepest previous intersects produced high-grade gold results, demonstrating that the deposit remains open at depth below the current Mineral Resource.

Significant results from these **extensional drillholes** include:

- **8m @ 4.50g/t Au** from 95m, including **1m @ 19.5g/t Au** from 99m in INRC25086
- **4m @ 4.85g/t Au** from 99m, including **1m @ 11.8g/t Au** from 99m in INRC25115
- **5m @ 4.12g/t Au** from 157m, including **1m @ 14.2g/t Au** from 160m in INRC25118
- **7m @ 2.22g/t Au** from 126m, including **1m @ 5.85g/t Au** from 131m in INRC25121

The results from infill drillholes inside the conceptual pit shell continue to highlight the strong continuity of gold mineralisation across the entire deposit.

Significant results returned from **infill drilling** include:

- **7m @ 2.28g/t Au** from 29m, including **1m @ 7.69g/t Au** from 30m in INRC25082
- **6m @ 2.75g/t Au** from 53m, including **2m @ 6.97g/t Au** from 55m in INRC25082
- **6m @ 3.47g/t Au** from 94m, including **2m @ 7.68g/t Au** from 94m in INRC25081
- **4m @ 5.50g/t Au** from 82m, including **1m @ 20.1g/t Au** from 82m in INRC25084

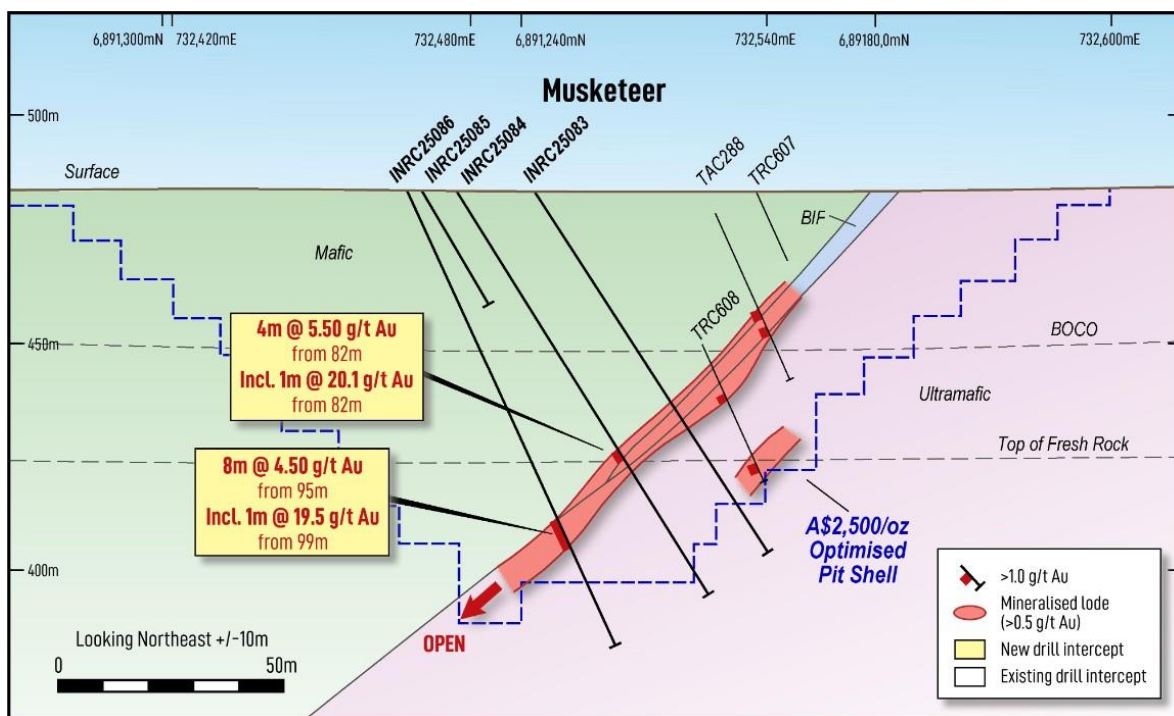

Figure 5 - Musketeer Cross-section A-A'

Figure 6 - Musketeer Cross-section B-B'

Indomitable East

The gold mineralisation at Indomitable East is hosted within a north-northwest to south-southeast trending sequence of jaspilitic banded iron formation intercalated with deeply weathered ultramafic rocks. The BIF outcrops at surface in the area and dips steeply to the north. Mineralisation is typically characterised by a visible zone of pyrite+/-quartz veining associated with the band iron formation units and appears to increase when proximal to two interpreted cross cutting structures.

The current program of **10 drill holes for ~1,600m** targeted extensions to mineralisation along strike and at depth and further infill mineralisation within a portion of the current Mineral Resource, ensuring sufficient drill spacing for future MRE updates to support Indicated resource classification.

Significant results from **extensional drilling** include:

- **4m @ 2.06g/t Au** from 189m in INRC25092
- **6m @ 1.38g/t Au** from 158m in INRC25091

Significant assay results returned from **infill drilling** include;

- **26m @ 1.39g/t Au** from 22m, including **1m @ 10.4g/t Au** from 30m in INRC25095

Mineralisation remains open at depth and along strike, and there is opportunity to further grow the current mineral resource with additional drilling.

As part of the PFS underway, Brightstar is undertaking re-optimisations of the deposits at Sandstone at higher gold prices, to assess the potential for larger economic pit shells.

Figure 7 – Plan view map of the Indomitable East RC drill locations

Cessna

The Cessna prospect forms part of the Indomitable Camp and is therefore located in close proximity to the Indomitable East and Musketeer deposits reported in this announcement. The RC drilling was designed to follow up significant gold mineralisation intersected in previous drilling.

The gold mineralisation at the Cessna prospect is hosted within a sequence of jaspilitic banded iron formation intercalated with deeply weathered mafic and ultramafic rocks. Mineralisation is typically characterised by a visible zone of pyrite+/-quartz veining associated with the banded iron formation units.

Significant assay results returned from the current RC drilling program include;

- **6m @ 6.91g/t Au** from 28m, including **4m @ 9.44g/t Au** from 28m in INRC25113
- **9m @ 2.20g/t Au** from 18m, including **1m @ 12.4g/t Au** from 20m in INRC25110
- **3m @ 2.25g/t Au** from 45m in INRC25110
- **2m @ 2.50g/t Au** from 183m in INRC25108

Further drilling is planned to delineate the extent of the mineralisation and improve geological understanding in order to enable a maiden Mineral Resource Estimate and assessment within the PFS.

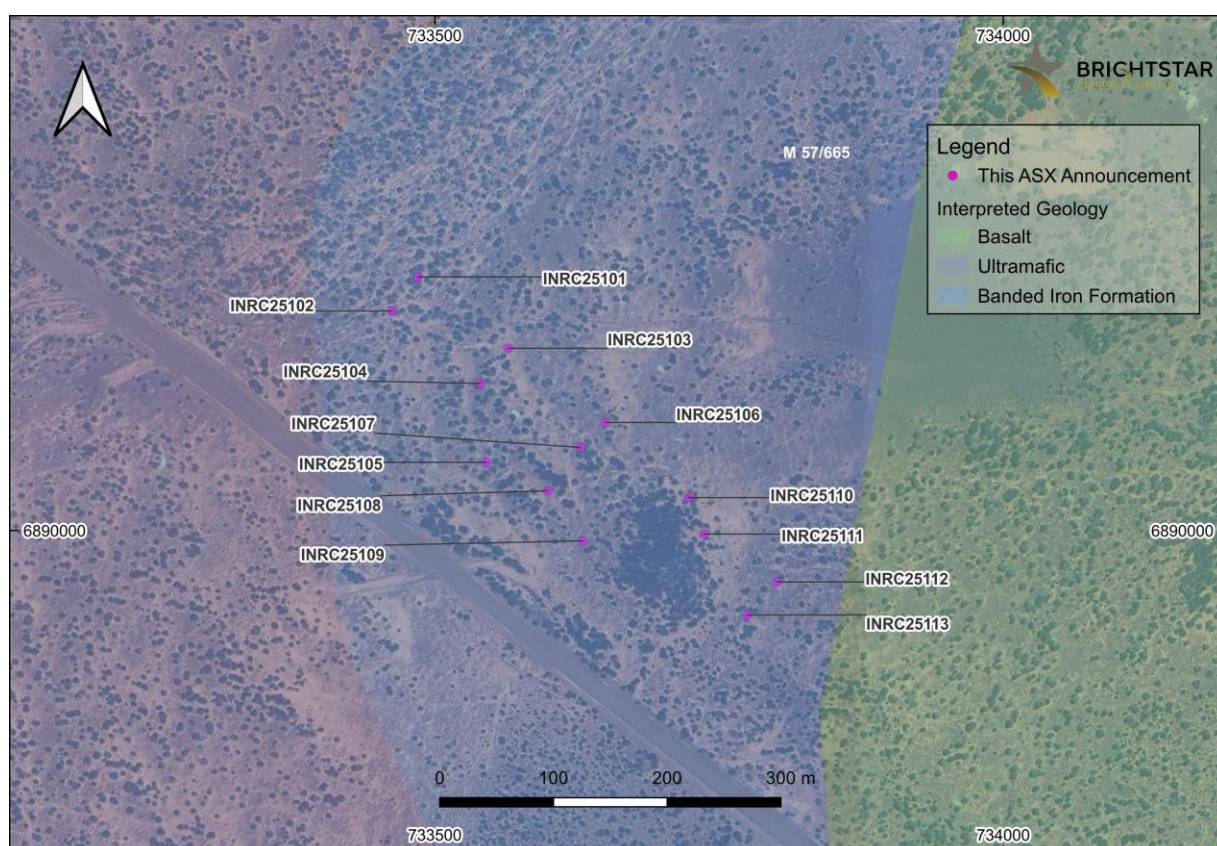

Figure 8 – Plan view map of the Cessna RC drill locations

Lord Henry

The Lord Henry deposit forms part of the **Lords Camp**, which hosts a total MRE of **7.8Mt @ 1.5g/t Au for 389koz Au** across the Lord Nelson and Lord Henry deposits.

The gold mineralisation at the Lord Henry deposit comprises a series of stacked, north dipping lodes characterised by quartz-sericite-chlorite-pyrite alteration within the granodiorite body. The overall trend of the mineralised zones is northeast with a defined length of 400m. High-grade gold intersections are associated with sulphide rich quartz veins and stringers.

The current program of **11 drill holes for ~1,360m** targeted extensions to mineralisation along strike to the west outside the current mineral resource.

Significant assay results returned from the current RC **extensional drilling** program include;

- **3m @ 9.29g/t Au** from 55m, including **1m @ 25.1g/t Au** from 55m; and
- **4m @ 19.3g/t Au** from 98m, including **1m @ 58.5g/t Au** from 99m in LHRC25008
- **3m @ 2.66g/t Au** from 92m, including **1m @ 4.69g/t Au** from 92m in LHRC25004
- **1m @ 6.24g/t Au** from 76m in LHRC25001

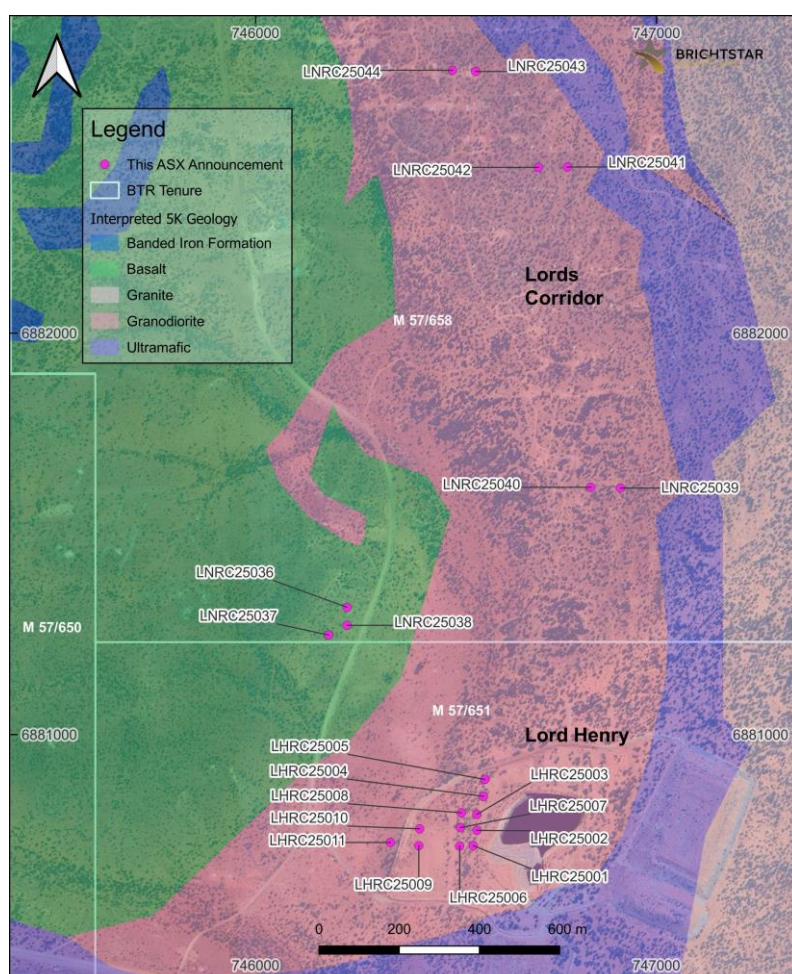

Figure 9 – Plan view map of the Lord Henry and Lords Corridor RC drill locations

Lords Corridor

At the Lords Corridor prospect, linking the Lord Nelson and Lord Henry deposits ~3km apart, RC drilling was designed to follow up mineralisation intersected in previous drilling close to the contact between the granodiorite and footwall ultramafic approximately 500m south of the Lord Nelson deposit. Three RC drill holes targeted the contact between the granodiorite and the hanging wall mafic unit (i.e. western contact) approximately 500m north of the Lord Henry deposit.

Significant assay results returned from the current RC drilling program include;

- **24m @ 1.14g/t Au** from 16m, including **4m @ 3.77g/t Au** from 36m in LNRC25040
- **4m @ 1.13g/t Au** from 96m in LNRC25043
- **4m @ 1.59g/t Au** from 116m in LNRC25044

MONTAGUE PROJECT

The **Duplex prospect** is located approximately 3.5km south of the Montague-Boulder Deposit, along the western margin of the Montague Granodiorite. Duplex currently has no Mineral Resource and represents an opportunity for Brightstar to potentially delineate a maiden MRE in the coming months.

Mineralisation at Duplex appears to be associated with quartz veining and disseminated sulphides associated with subtle sub-vertical shearing within a north-south trending intrusive gabbro unit.

The current program of **14 drill holes for ~2,300m** targeted **extensions** to high-grade mineralisation intersected in previous drilling.

Significant assay results returned from RC drilling include;

- **2m @ 7.94g/t Au** from 145m, including **1m @ 15.4g/t Au** from 145m in DXRC25012
- **2m @ 5.87g/t Au** from 177m, including **1m @ 11.0g/t Au** from 177m in DXRC25001
- **5m @ 2.71g/t Au** from 154m, including **1m @ 9.93g/t Au** from 156m in DXRC25008
- **2m @ 2.79g/t Au** from 74m, including **1m @ 4.47g/t Au** from 74m in DXRC25005
- **8m @ 1.07g/t Au** from 55m, including **1m @ 5.17g/t Au** from 56m in DXRC25009
- **2m @ 4.40g/t Au** from 142m in DXRC25006
- **1m @ 6.13g/t Au** from 47m in DXRC25009

The grades encountered in the program confirm the historical drilling and highlight the presence of a north-south mineralised shear zone. Further drilling is planned to delineate the extent of the mineralised structures and improve geological understanding.

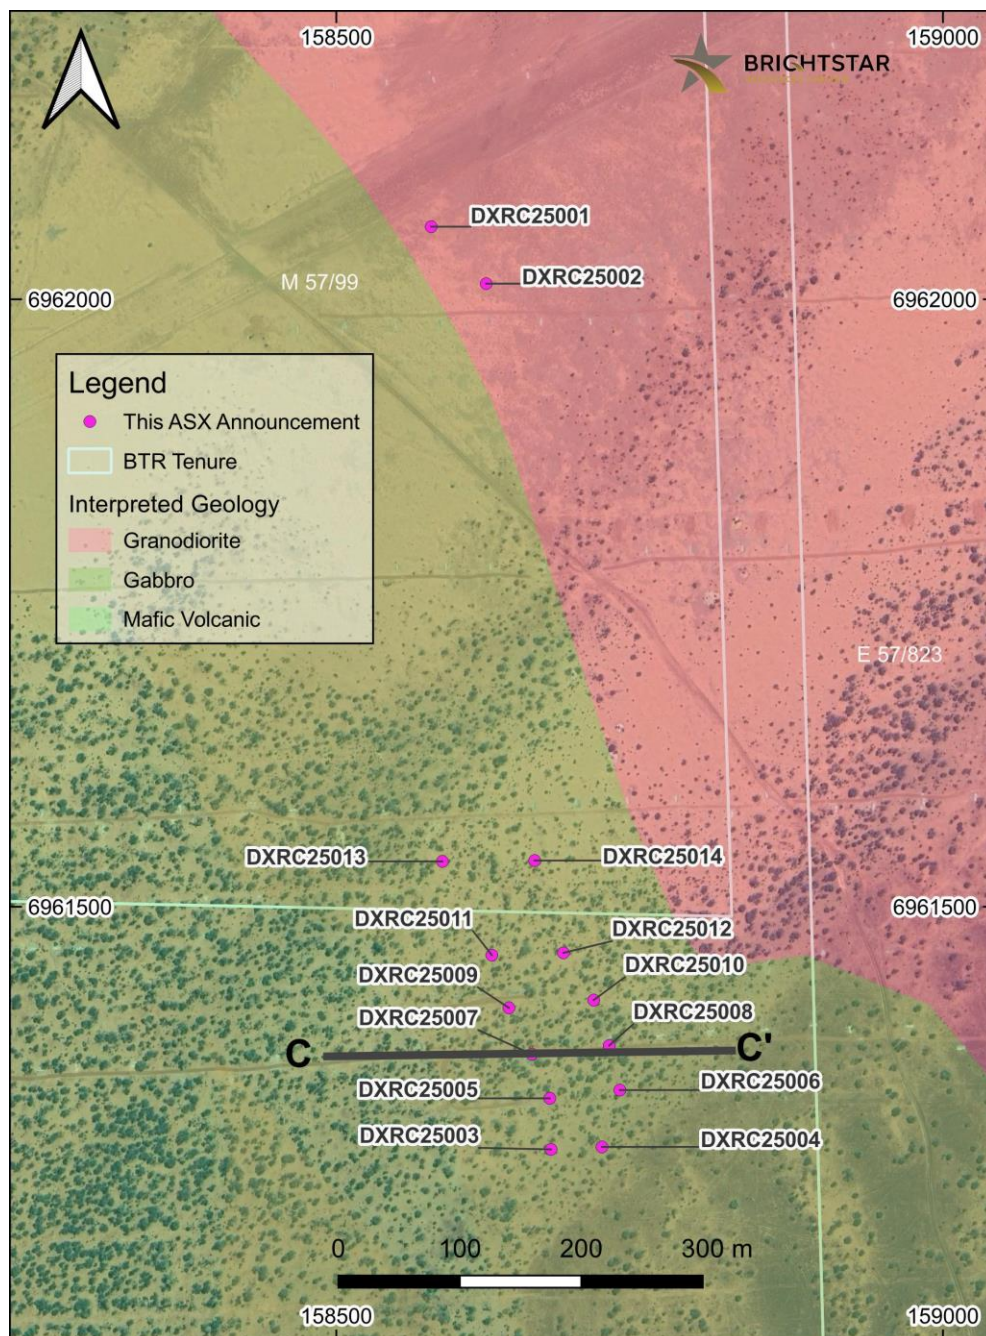

Figure 10 – Plan view map of the Duplex RC drill locations

Figure 11 – Duplex Cross-section C-C'

The **Whistler Deposit** is located along the western margin of the Montague Granodiorite and has a total resource of **1.7Mt @ 2.2g/t Au for 120koz**.

The current program of **2 drill holes for ~460m** targeted extensions to mineralisation along strike to the south outside the current mineral resource.

Significant assay results returned from RC drilling include;

- **3m @ 3.10g/t Au** from 30m, including **1m @ 6.26g/t Au** from 30m in WHRC25002

Further drilling is planned to delineate the extent of the deeper mineralised structures and improve geological understanding.

Next Steps

Diamond drilling is currently underway at the Yunndaga Deposit (Menzies Hub). The RC drill rig has completed a second phase of drilling at Yunndaga and has moved to the Second Fortune project prior to returning to the Sandstone Hub. Brightstar will provide update from this drilling as results are received and analysed.

This ASX announcement has been approved by the Managing Director on behalf of the board of Brightstar.

ABOUT BRIGHTSTAR RESOURCES

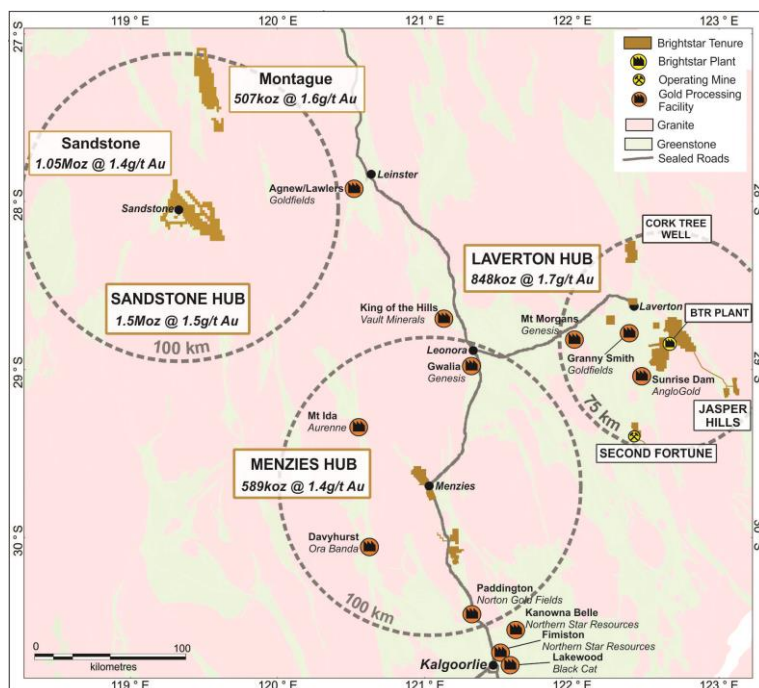

Brightstar Resources Limited is an emerging gold development company listed on the Australian Securities Exchange (ASX: BTR) and based in Perth, WA.

The Company hosts a portfolio of high-quality assets hosted in the Tier-1 jurisdiction of Western Australia, with 3.0Moz of Mineral Resources across the Goldfields and Murchison regions, ideally located near key infrastructure such as sealed highways and on granted mining leases for ready development.

Brightstar owns and operates the underground Second Fortune and Fish Gold Mines south of Laverton, which are processed by Genesis Minerals Ltd (ASX: GMD) at their Laverton Mill under an Ore Purchase Agreement.

A Definitive Feasibility Study on the Menzies and Laverton Gold Projects, released in June 2025, outlined the production of approximately 70,000oz per annum for five years across several open pit and underground mines. This production is set to deliver excellent financial metrics, including life-of-mine cash flows of A\$461 million and internal rate of return (IRR) of 73% at A\$5,000/oz gold price.

Brightstar aspires to be a leading mid-tier gold miner via a staged growth strategy, with current operations and proposed expansions providing a great platform for growth.

Refer MRE Note below. Note some rounding discrepancies may occur.

Pericles, Lady Shenton & Stirling consolidated into Lady Shenton System.

Warrior, Lady Harriet & Bellenger consolidated into Lady Harriet System.

Note 1: Julias is located on M57/427, which is owned 75% by Brightstar and 25% by Estuary Resources Pty Ltd

Note 2: Attributable gold ounces to Brightstar include 75% of resources of Julias as referenced in Note 1.

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Brightstar Resources Limited's planned exploration program and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Brightstar believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that further exploration will result in the estimation of a Mineral Resource.

Competent Person Statement – Exploration

The information presented here relating to exploration of the Menzies, Laverton and Sandstone Gold Project areas are based on information compiled by Mr Michael Kammermann, MAIG. Mr Kammermann is a Member of the Australasian Institute of Geoscientists (AIG) and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a “Competent Person” as that term is defined in the 2012 Edition of the “Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012)”. Mr Kammermann is a fulltime employee of the Company in the position of Exploration Manager and has provided written consent approving the inclusion of the Exploration Results in the form and context in which they appear.

Competent Person Statement – Mineral Resource Estimates

This Announcement contains references to Brightstar’s JORC Mineral Resource estimates, extracted from the ASX announcements titled “Cork Tree Well Resource Upgrade Delivers 1Moz Group MRE” dated 23 June 2023, “Maiden Link Zone Mineral Resource” dated 15 November 2023, “Aspacia deposit records maiden Mineral Resource at the Menzies Gold Project” dated 17 April 2024, “Brightstar Makes Recommended Bid for Linden Gold”, dated 25 March 2024, “Brightstar to drive consolidation of Sandstone Gold District” dated 1 August 2024 and “Scheme Booklet Registered by ASIC” dated 14 October 2024 and “Robust Mineral Resource Upgrades at Laverton and Menzies Underpins Future Mining Operations” dated 19 May 2025.

Brightstar confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the Mineral Resource estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person’s findings are presented have not been materially modified from the original market announcements.

Compliance Statement

With reference to previously reported Exploration Results and Mineral Resources, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement and, in the case of estimates of Mineral Resources that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The company confirms that the form and context in which the Competent Person’s findings are presented have not been materially modified from the original market announcement.

APPENDIX 1: JORC CODE, 2012 EDITION – TABLE 1

SECTION 1 SAMPLING TECHNIQUES AND DATA

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>Drilling carried out by Brightstar Resources Ltd (BTR)</p> <ul style="list-style-type: none"> Industry standard RC drilling and sampling protocols for lode and supergene gold deposits have been utilised throughout the BTR campaign. BTR RC holes were sampled using 4m composite spear samples or 1 metre cone-split samples. RC drilling techniques are used to obtain samples of the entire downhole length. Brightstar’s samples were submitted to Intertek Laboratory in Perth where the sample was analysed by Photon. Sample spoils from selected RC drill holes were placed into green bags for possible future use when required. <p>Drilling carried out by Alto Metals Ltd (SRC prefixes)</p> <ul style="list-style-type: none"> RC samples were passed directly from the in-line cyclone through a rig mounted cone splitter or multi-tier riffle splitter. Samples were collected in 1m intervals and 1m calico splits. The bulk sample was placed directly onto the ground and the Alto samples were sent directly to MinAnalytical Laboratory Services Pty Ltd (“MinAnalytical”). Field duplicate samples were collected using a second calico bag on the drill rig cyclone. <p>Drilling carried out by Troy Resources NL (TRC and TAC prefixes)</p>

Criteria	JORC Code Explanation	Commentary
		<ul style="list-style-type: none"> RC samples were passed directly from the in-line cyclone through a rig mounted multi-tier riffle splitter. From the bulk samples a 5m composite sample was collected using a PVC scoop and then submitted to the laboratory for analysis. Troy samples were sent to SGS Australia Pty Ltd (SGS). Where anomalous gold zones were detected, 1m re-split samples were collected later and submitted to the laboratory. <p>Drilling carried out by Gateway Mining Limited (GRC and GWAC prefixes)</p> <ul style="list-style-type: none"> Air-core drill hole samples were collected by either nominal 4m composite or as 1m individual samples collected via spear method from 1m bulk samples. End of hole samples were collected as separate 1m spear sample. Reverse circulation drilling samples were ~2-3kg split from dry 1m bulk samples. The sample was initially collected via the cyclone in an inline collection box. Once the metre was completed the sample was dropped under gravity through a cone splitter, with the 1m split for assay collected in a calico bag. The bulk reject from the sample was dumped into neat piles on the ground. Field duplicates were collected at a ratio of 1:50 and collected at the same time as the original sample. OREAS certified reference material (CRM) was inserted at a ration of 1:50. The grade ranges of the CRMs were selected based on grade populations and economic grade ranges.
Drilling techniques	<ul style="list-style-type: none"> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard</i> 	<ul style="list-style-type: none"> BTR RC drill holes were drilled utilising a 5.5 inch face sampling hammer and surveyed using an Axis Champ true-North-seeking

Criteria	JORC Code Explanation	Commentary
	<i>tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	<p>gyroscopic survey tool. Drilling was conducted by Topdrill using a Schramm C685 drill rig with a booster compressor.</p> <ul style="list-style-type: none"> Alto and Gateway RC drilling used a KWL 350 drill rig with an onboard 1100cgm/350psi compressor and a truck mounted 1000cfm auxiliary and 1000psi booster. The face sampler had a nominal 140mm hole. It is not known what type of RC rig was used by Troy however it is most likely to have been a face sampling hammer. Gateway Air-core – Bostech Drilling rig was used which consisted of a custom-built truck mounted air-core rig with on board compressor.
Drill sample recovery	<ul style="list-style-type: none"> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<ul style="list-style-type: none"> RC sample recovery was qualitatively assessed and recorded by comparing drill chip volumes (sample bags) for individual metres. Sample depths were cross-checked every rod (6m). The cyclone was regularly cleaned to ensure no material build up and sample material was checked for any potential downhole contamination. Wet samples were recorded, although the majority of samples were dry. In the CP's opinion, the drilling sample recoveries/quality are acceptable and are appropriately representative for the style of mineralisation Sample recoveries are recorded on sample registers with sample recovery and moisture content estimated. Good sample recovery was standard in reported programs. No grade versus sample recovery biases, or biases relating the loss or gain or fines have been identified in BTR's drilling. All samples are weighed at the laboratory and reported as a part of standard preparation protocols. No water compromised samples are reported in this program. Drilling is carried out orthogonal to the mineralisation to get

Criteria	JORC Code Explanation	Commentary
		<p>representative samples of the mineralisation.</p> <ul style="list-style-type: none"> • RC samples are collected through a cyclone and cone splitter. The sample required for the assay is collected directly into a calico sample bag at a designed 2kg sample mass which is optimal by Photon method. • Alto and Gateway sample recovery was estimated as a percentage and recorded on field sheets prior to entry into the database. ▪ There are no available records of Troy sample recovery.
Logging	<ul style="list-style-type: none"> • <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<ul style="list-style-type: none"> • BTR RC holes were logged on one metre intervals at the rig by the geologist from drill chips. Logging was recorded directly into LogChief computer software. • Detailed geological logging includes the lithology, alteration, veining and mineralisation of the drill chips or core. • Logging is both quantitative and qualitative in nature, depending on the feature. • 100% of BTR drilling is geologically logged. ▪ Alto and Gateway drill chips were sieved from each 1m sample and geologically logged. Washed drill chips from each 1m sample were stored in chip trays. Geological logging of drill hole intervals was carried out with sufficient detail to meet the requirements of resource estimation. • Troy drill holes were logged using detailed geological codes that were correlated with Alto/BTR logging codes and logging is of sufficient detail to meet the requirements of resource estimation.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> 	<p>Brightstar RC drilling</p> <ul style="list-style-type: none"> • RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. • For interpreted non-mineralised areas, 4 metre composite

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<p>samples were collected from the drill rig by spearing each 1m collection bag. The 4 metre composites were submitted for assay.</p> <ul style="list-style-type: none"> • For interpreted mineralised areas, the 1 metre splits were bagged on the static cyclone splitter on the RC rig. • Duplicate samples were taken over selected interpreted mineralised intervals to determine if sampling is representative. • Sample preparation comprised industry standard oven drying, crushing, and pulverisation to less than 75 microns. Homogenised pulp material was used for assaying. • Samples volumes were typically 1.0-4.0 kg and are considered to be of suitable size for the style of mineralisation. • Sample sizes were appropriate to give an indication of mineralisation. • The technique was appropriate for the material and style of mineralisation. <p>Alto Metals RC drilling</p> <ul style="list-style-type: none"> • RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. • Samples were collected in 1m intervals in calico bags. • All 1m calicos were collected and sent directly to MinAnalytical Laboratory Services Pty Ltd ("MinAnalytical"). • Field duplicates were collected using a second calico bag on the drill rig cyclone • Samples submitted for analysis via Photon assay technique were dried, crushed to nominal 85% passing 2mm, linear split and a nominal 500g sub sample taken (method code PAP3502R). <p>Troy Resources NL drilling</p> <ul style="list-style-type: none"> • AC and RC samples were passed directly from a cyclone through a

Criteria	JORC Code Explanation	Commentary
		<p>rig mounted multi-tier riffle splitter and samples were collected in 1m intervals into bulk plastic bags and 1m calico splits (which were retained for later use).</p> <ul style="list-style-type: none"> • From the bulk sample, a 5m composite sample was collected using a split PVC scoop and then submitted to the laboratory for analysis. • The 1m calico splits were submitted to the laboratory if the composite sample returned assay values +1g/t Au over the anomalous zone. ▪ Samples were collected Troy submitted 1 duplicate for every 50m of drilling. <p>Gateway Mining drilling</p> <ul style="list-style-type: none"> ▪ AC samples were spear sampled from 1m bulk sample and combined into a nominal 4m composite sample or sampled as individual 1m samples. The end of hole sample was collected as a 1m spear sample. ▪ RC samples were split from dry, 1m bulk sample via cone splitter directly from the cyclone. ▪ All samples were analysed for gold using the Au-AA26 technique which is a 50g lead collection fire assay. ▪ The QC procedure adopted through the process includes; <ul style="list-style-type: none"> ▪ Field duplicates were collected at a rate of 1:50, these were collected during drilling at the same time as the primary sample. ▪ OREAS CRMs were inserted at a rate of 1:50.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the</i> 	<p>Brightstar Resources Ltd</p> <ul style="list-style-type: none"> • 1m and 4m composite samples were assayed by Fire Assay (FA50)

Criteria	JORC Code Explanation	Commentary
	<p><i>parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i></p> <ul style="list-style-type: none"> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<p>by Bureau Veritas Laboratories for gold.</p> <ul style="list-style-type: none"> Laboratory QC involves the use of internal lab standards, certified reference material, blanks, splits and replicates. QC results (blanks, coarse reject duplicates, bulk pulverised, standards) are monitored and were within acceptable limits. ~5% standards were inserted to check on precision of laboratory results. <p>Alto RC drilling</p> <ul style="list-style-type: none"> 1m RC samples were transported to MinAnalytical, located in Perth, Western Australia, who were responsible for sample preparation and assaying for all RC drill hole samples and associated check assays. MinAnalytical were NATA certified for all related inspection, verification, testing and certification activities. Samples submitted for analysis via Photon assay technique were dried, crushed to nominal 85% passing 2mm, linear split and a nominal 500g sub sample taken (method code PAP3502R). The 500g sample was assayed for gold by Photon Assay (method code PAAU2) along with quality control samples including certified reference materials, blanks and sample duplicates. <p>Troy Resources NL</p> <ul style="list-style-type: none"> SGS Australia Pty Ltd (SGS) located in Perth, Western Australia were responsible for sample preparation and assaying for drill hole samples and associated check assays. SGS at the time was certified to the ISO 9001 requirements for all related inspection, verification, testing and certification activities. RC samples were assayed using a 50g fire assay with AAS finish, and sample sizes were noted as being 2kg. For Troy RC drilling, an average of 1 field duplicate, 1 blank and 1

Criteria	JORC Code Explanation	Commentary
		<p>standard was submitted for every 50 samples.</p> <ul style="list-style-type: none"> • Troy engaged Maxwell to undertake periodic audit of the exploration QAQC data on a monthly basis. ▪ Laboratory Repeat assays were reported for Troy drill assays <p>Gateway Mining</p> <ul style="list-style-type: none"> ▪ Drill samples were submitted to Intertek Perth. All samples were analysed by 50g fire assay which is a total digest assay technique. ▪ Field duplicates were collected Field duplicates were collected at a rate of 1:50, these were collected during drilling at the same time as the primary sample.
Verification of sampling and assaying	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<p>Brightstar Resources Ltd:</p> <ul style="list-style-type: none"> • Significant intersections have been reviewed by several company personnel. • Data storage was captured electronically onsite using Logchief before uploading to a cloud-based server and imported into an externally managed Datashed geological database. • Security is set through both SQL and Datashed configuration software. Brightstar has an external consultant Database Administrator with expertise in programming and SQL database administration. • The database assay management system records all metadata within the MDS, providing full audit trails to meet industry best practice. • No data was adjusted. No transformations or alterations are made to assay data stored in the database. The lab's primary Au field is the one used for plotting purposes. No averaging of results for individual samples is employed. No top cuts are applied to the

Criteria	JORC Code Explanation	Commentary
		<p>assays when calculating intercepts.</p> <p>Alto Metals Ltd</p> <ul style="list-style-type: none"> • Significant intersections were reviewed by alternative company personnel. • The drilling program included extension and infill drill holes therefore twinned holes were not applicable • Field data was recorded on logging sheets and entered into excel prior to uploading to and verification in Micromine and Datashed. • Laboratory data was received electronically and uploaded to and verified in Micromine and Datashed. • Values below the analytical detection limit were replaced with half the detection limit value or assigned a value of -0.005ppm Au in the database. <p>Troy Resources NL</p> <ul style="list-style-type: none"> • Drilling carried out by Troy was compiled by Alto from WA Dept Mines Open File records (WAMEX). <ul style="list-style-type: none"> ▪ Data was transferred from WAMEX digital files to Alto's database. The original WAMEX files were generally in excel or text format and were readily imported into Alto's database which was then imported into Brightstar's database. <p>Gateway Mining</p> <ul style="list-style-type: none"> ▪ Drilling results are cross checked by company geologists. ▪ Data is recorded digitally at the project with Micromine Geobank software. ▪ Assay results are received digitally. ▪ All data is stored within Datashed SQL Database.

Criteria	JORC Code Explanation	Commentary
Location of data points	<ul style="list-style-type: none"> • <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> • <i>Specification of the grid system used.</i> • <i>Quality and adequacy of topographic control.</i> 	<p>Brightstar Resources Ltd</p> <ul style="list-style-type: none"> • All drill collar locations were initially surveyed using a hand-held GPS, accurate to within 3-5m. • Post drilling, a qualified contract surveyor picked up the hole collars with a RTK DGPS accurate to cm scale. • The grid system used is MGA94 Zone 51. All reported coordinates are referenced to this grid. • The site topography utilised a DTM from 2019 with accuracy <1m. <p>Alto Metals Ltd</p> <ul style="list-style-type: none"> • Alto used handheld Garmin GPS to locate and record drill collar positions, accurate to +/-5 metres (northing and easting), which is sufficient for exploration drilling. • Subsequently the collars were surveyed by Alto personnel using a Stonex S700A GNSS Receiver (DGPS) with accuracy +/-0.10m, or by RM Surveys (licensed surveyor) with TRK GPS with accuracy of +/-0.05m to record the easting, northing and RL prior to drill holes being used for resource estimation. • The grid system used was MGA94 Zone 50. • Downhole surveys were undertaken by the drilling contractor at 30m intervals using a true north seeking gyro. • Alto had previously engaged an independent downhole survey company to carry out an audit of downhole surveys and the results were considered satisfactory. <p>Troy Resources NL</p> <ul style="list-style-type: none"> • Troy drilling was located with DGPS in AGD84 Zone 50 ▪ No downhole survey data was reported, however it is considered unlikely that variation from the reported dip over the short

Criteria	JORC Code Explanation	Commentary
		<p>drillhole lengths would be materially significant.</p> <p>Gateway Mining</p> <ul style="list-style-type: none"> Drill holes recorded with a Garmin GPS (+/-3m). Hole dips determined at the collar by clinometer, with no down hole surveys.
Data spacing and distribution	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<p>Brightstar Resources Ltd</p> <ul style="list-style-type: none"> Holes are variably spaced with the intent of infilling hole spacings to a nominal 20m x 20m pattern across the deposits. No sample compositing of field samples has been applied. Spacing and distribution is sufficient to establish the degree of geological grade and continuity for a mineral resource estimation. <p>Alto Metals Ltd</p> <ul style="list-style-type: none"> Holes were spaced at 40m spacing along 40m spaced lines. Spacing and distribution is sufficient to establish the degree of geological grade and continuity for a mineral resource estimation. Sample compositing was not utilised <p>Troy Resources NL</p> <ul style="list-style-type: none"> Holes were spaced at 20-60m along 20-40m spaced lines. Sample compositing was not utilised.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling</i> 	<ul style="list-style-type: none"> The relationship between the drilling orientation and the orientation of mineralised structures is not considered to have introduced a sampling bias. Most holes have been drilled perpendicular to the main orientation of mineralisation. No drilling orientation related sampling bias has been identified at

Criteria	JORC Code Explanation	Commentary
	<i>bias, this should be assessed and reported if material.</i>	the project.
Sample security	<ul style="list-style-type: none"> <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> Brightstar samples were collected on site under supervision of the geologist. Visitors needed permission to visit site. Once collected samples were bagged, they were transported to Kalgoorlie by company personnel or trusted contractors for assaying with Bureau Veritas transporting samples from Kalgoorlie to Perth. Despatch and consignment notes were delivered and checked for discrepancies. Alto 1m RC samples were collected in labelled and tied calico bags under the supervision of the rig geologist. Sample bags were placed by company personnel in larger plastic polyweave bags then into a bulka bag that was tied and dispatched to the laboratory via freight contractors or company personnel. Upon receipt of the samples the laboratory checked the sample IDs and total number of samples and notified Alto of any differences from the submission forms. <ul style="list-style-type: none"> Troy reported that their drill samples were collected in a labelled and tied calico bag. Up to six calico bags were then placed in a larger polyweave bag that was labelled with the laboratory address and sender details and tied with wire. The polyweave bags were picked up by a courier firm who counted the number of polyweave bags before taking them to the Mt Magnet depot. The samples were picked up by the courier's road train and transported to Perth. Upon receipt of the samples the laboratory checked the sample IDs and total number of samples and notified Troy of any differences from the submission forms. Gateway samples are sealed into green / polyweave bags and cable tied. These are then sealed in bulka bags and transported to the laboratory in Perth by company staff or contractors or

		established freight companies.
Audits or reviews	<ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> Sampling techniques and data have been reviewed internally by company personnel.

SECTION 2 REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Musketeer and Indomitable East deposit, and the Cessna Prospect are located within Mining Lease M57/665. The Lord Henry deposit is located within Mining Lease M57/651. The Lords corridor prospect is located within Mining Lease M57/658. M57/665, M57/651 and M57/658 are granted tenements owned 100% by Sandstone Exploration Pty Ltd, a 100% owned subsidiary of Brightstar Resources Limited and are held in good standing with no known impediments. Royalties include up to 2% of the Gross Revenue payable to a third party, and a 2.5% royalty payable to the State Government. Duplex Prospect is located within E57/807 and M57/99. Whistler Deposit is located within mining lease M57/217. Granted tenements with gold rights owned 100% by Brightstar Resources Limited held in good standing with no known impediments. Brightstar, via its wholly-owned subsidiary Montague Gold Project Pty Ltd (MGP), has acquired the interests held by Gateway and its wholly owned subsidiary Gateway Projects Pty Ltd (GPWA) in certain mining tenements in respect of Gateway's Montague Gold Project, with Brightstar obtaining 100% of the gold mineral rights and Gateway retaining all other mineral rights.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<p><u>Indomitable East, Musketeer, Cessna, Lord Henry, Lords Corridor</u></p> <ul style="list-style-type: none"> Modern exploration for gold in the Sandstone Greenstone belt began with Western Mining Corporation (WMC) in the late 1970s through to the 1990s. WMC carried out 17 significant regional exploration programs and formed several joint ventures in the main Sandstone mines area and at Oroya, Hacks, and Bull Oak. After spending approximately \$6M, WMC put its Sandstone assets out to tender, with Herald ultimately the successful bidder.

		<ul style="list-style-type: none"> • Herald carried out extensive exploration throughout the project area and carried out open pit mining at Bull Oak and Oroya. The Sandstone tenements were then sold to Troy Resources NL (Troy). • Troy undertook systematic exploration of the project area between 1998 and 2010, resulting in the discovery and subsequent mining of the Bulchina, Lord Henry and Lord Nelson deposits. Troy ceased mining in August 2010 and the operations were placed in care and maintenance. <ul style="list-style-type: none"> ▪ There has been no previous mining at Musketeer, previous work carried out by Troy at Musketeer included aircore (AC) and reverse circulation (RC) drilling. ▪ Troy Resources discovered the Lord Henry deposit in 2004 and carried out open pit mining between 2005 and 2010 to produce approximately 48,000 ounces of gold. <p><u>Duplex and Whistler</u></p> <ul style="list-style-type: none"> ▪ Gold was discovered in the district during the gold rush era, first records of gold won from small-scale, high-grade workings include the Montague Mining Centre (1904-13). Renewed interest in the late 1960's included base metal exploration carried out within exposed stratigraphy of the Montague Ranges (Bungarra Ranges), exploration interest that broadened with the release of the Sandstone 1:250,000 aeromagnetic sheet in 1970 resulting in the staking of favourable magnetic anomalies by exploration companies. ▪ Early explorers in the Montague Ranges included Anaconda Australia Inc. (1966-67), followed by International Nickel Australia (1971-75) evaluating a Gabbro - banded differentiated basic complex believed prospective for copper and/or nickel such as the Duluth Gabbro, USA. Strong geophysical and mineralised anomalism was encountered, however, copper-zinc enrichment was also encountered in adjacent felsic stratigraphy at Ed's Bore prospect, which was followed-up by CRA Exploration (1983-1990)
--	--	--

		<p>to intersect polymetallic VMS enrichments at Bevan prospect (not substantively pursued).</p> <ul style="list-style-type: none"> At Montague, Western Mining Corporation (1976) conducted investigations for copper and gold including soil sampling and IP surveying, which was followed by CRA Exploration (1984-89) working concurrently with AMOCO Minerals Australia Company (1984) and Clackline Refractories Ltd (from 1985 - to later become Herald Resources) assessing/purchasing historic mine areas from Mr W.J. Griffiths of Sandstone. RAB drilling penetrating transported cover resulted in the virgin discoveries of NE Pit by AMOCO and Whistler deposit by CRA. Later noted explorers included Dalrymple Resources NL (1987-1990) intersecting gold at the Armada (Twister) prospect, and Arimco Mining (1990- 98) intersecting gold at Lyle prospect, Victory West prospect, and copper at The Cup prospect (not substantively pursued). The Montague Mining Centre produced approximately 150,000oz of gold commencing in 1986 at Caledonian and NE Pits (Clackline), and continued at Montague Boulder from 1988 (Herald), and was to close in 1993 after completion of the Rosie Castle open cut (Herald). Whistler open cut was mined from November 1990 (Polaris Pacific NL) and ore toll treated through the Herald mill. Little attention was paid to mineralisation other than gold. Gateway Mining in joint venture with Herald Resources continued exploration of the Montague Mining Centre, Gateway also targeting poly-metallic intrusion related - VMS models in the district from 2006.
Geology	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<p><u>Indomitable East, Musketeer, Cessna</u></p> <ul style="list-style-type: none"> The Sandstone Project covers much of the Sandstone Greenstone Belt, a triangular belt interpreted to be a north plunging antiform situated at the northern end of the Southern Cross Domain. The belt comprises mafic volcanic and intrusive units, with

		<p>subordinate ultramafic, BIF and siliciclastic sediments.</p> <ul style="list-style-type: none"> • Much of the residual greenstone belt regolith is overlain by depositional material including colluvium, sheet wash alluvium and aeolian deposits. The alluvium thins in the northern and eastern parts of the project area where underlying meta-sediments and granitoids are exposed at the surface. A lateritic horizon is observed over much of the belt. • The Musketeer deposit is located within the Indomitable Camp, in an area of alluvium covering deeply weathered, mafic and ultramafic units and banded iron formation. There is no outcrop at Musketeer. Gold mineralisation is associated with a southwest-northeast striking banded iron formation within a mafic-ultramafic package and northwest-southeast cross cutting structures. Depth to fresh rock is approximately 100m. • At Indomitable East the stratigraphy is subvertical and has an east-west strike. Two main geological units are observed being a northern deeply weathered ultramafic unit and a southern unit comprising interlayered banded iron formation within deeply weathered ultramafic. Weathered banded iron formation is exposed on the surface. Elsewhere there is no outcrop. • At Indomitable East the gold mineralisation appears to be constrained to the banded iron formation/ ultramafic package. • The gold mineralisation at Cessna is hosted within a sequence of jaspilitic banded iron formation (BIF) intercalated with deeply weathered mafic and ultramafic rocks. Mineralisation is typically characterised by a visible zone of pyrite+/-quartz veining associated with the banded iron formation units. <p><u>Lord Henry, Lords Corridor</u></p> <ul style="list-style-type: none"> • The Lord Henry deposit occurs along the southern end of the granodiorite intrusion. • At Lord Henry, the granodiorite body is bounded to the south and
--	--	---

		<p>west by a sheared ultramafic contact.</p> <ul style="list-style-type: none"> • Mineralisation comprises a series of stacked, -20° to -30° north dipping lodes characterised by quartz-sericite-chlorite-pyrite alteration within the granodiorite body. • The overall trend of the mineralised zones is northeast with a defined length of 400m. High-grade gold intersections are associated with sulphide rich quartz veins and stringers. • The interpreted mineralisation domains for Lord Henry are based on a nominal 0.2 g/t Au to 0.3 g/t Au cutoff which appears to be a natural break in the grade distribution • The area between the Lord Nelson deposit and the Lord Henry deposit is termed the Lords Corridor. Previous drilling as occasionally intersected gold mineralisation within the granodiorite, mostly proximal to the footwall ultramafic contact in a similar setting to the Lord Nelson deposit. <p><u>Duplex</u></p> <ul style="list-style-type: none"> • The Montague East Project is located in the Gidgee district in the Archean Yilgarn Craton of Western Australia approximately 630km NE of Perth and 70km north from the township of Sandstone on the eastern central portion of the Gum Creek Greenstone Belt, of the Southern Cross Province. Metamorphic grade of the Gum Creek Greenstone Belt is estimated to be low grade greenschist facies. • Project lithology includes basalt/ash tuff/dolerite/gabbro, the Montague Granodiorite sub-volcanic intrusion (calc-alkaline - FI), dacite volcanic flow/s (FI), volcanoclastic sequences of felsic composition and epiclastic conglomerates, ultramafic intrusives and external orogenic granite plutons. Key regional characteristics of a Volcanic Arc Extensional Basin include calc-alkaline bimodal volcanic sequences associated with extensive iron formations. Later ENE-WSW orogenic compression event is characterised by
--	--	---

		<p>NNW regional scale faults/unconformities, NNW shearing and folding, slaty cleavage has developed within sediments near a tight syncline fold closure within the NE area of the project.</p> <ul style="list-style-type: none"> Mineralisation at Duplex appears to be associated with quartz veining and disseminated sulphides associated with subtle sub-vertical shearing/alteration within a north-south trending intrusive gabbro unit. <p><u>Whistler</u></p> <ul style="list-style-type: none"> The deposits are associated with the margins of a felsic intrusion, the Montague Granodiorite, with Whistler located at the northern tip, and Montague-Boulder on the western margin. At Whistler, mineralisation is mostly within the granodiorite, close to the contact with a basalt unit. The site of the mineralisation appears to be related to an embayment in the granodiorite contact. Drilling encountered mineralisation hosted within strongly silica-pyrite-chlorite altered granodiorite, associated with quartz-carbonate veining.
Drill hole Information	<ul style="list-style-type: none"> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the</i> 	<ul style="list-style-type: none"> Historical Drill holes have been referenced in this announcement. Relevant information is included in Appendix 2 and 3 at the end of this release.

	<i>understanding of the report, the Competent Person should clearly explain why this is the case.</i>	
Data aggregation methods	<ul style="list-style-type: none"> <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<ul style="list-style-type: none"> Assay results reported here have been length weighted. Significant intercepts are reported above 1.0 g/t Au with a maximum consecutive interval of internal dilution (<0.5 g/t Au) of 2m. No metal equivalent calculations were applied.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> 	<ul style="list-style-type: none"> Drillholes were angled at -60° and designed to intersect orthogonal to the host stratigraphy. True widths are not confirmed at this time although all drilling is planned close to perpendicular to interpreted strike of the target lodes at the time of drilling.
Diagrams	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> Refer to figures in this report.
Balanced reporting	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> Results from all drill holes in the program have been reported at a consistent cut-off grade (>1.0g/t Au) and their context discussed.

Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> No other exploration data is reported here.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Further resource definition / exploration drilling campaigns will be investigated for deeper mineralisation and if successful, further mineral resource estimates will be calculated.
